

- Metatarsophalangeal joints (correspondent to coordinate mtp_angle) have been locked.
- Marker LKneeLateral is not tracked because there are hints that has not been positioned exactly on the medial femoral epicondyle: feet are aligned but medial condyles are not.
- Knee angles are ~10 degrees. Not acceptable normally, but in this case the subject is 87 years old and his posture is not upright in the videos provided with the GC5 dataset materials. As a consequence, hip, knee and ankle joints angles in static pose were considered acceptable.
